Permutation testing

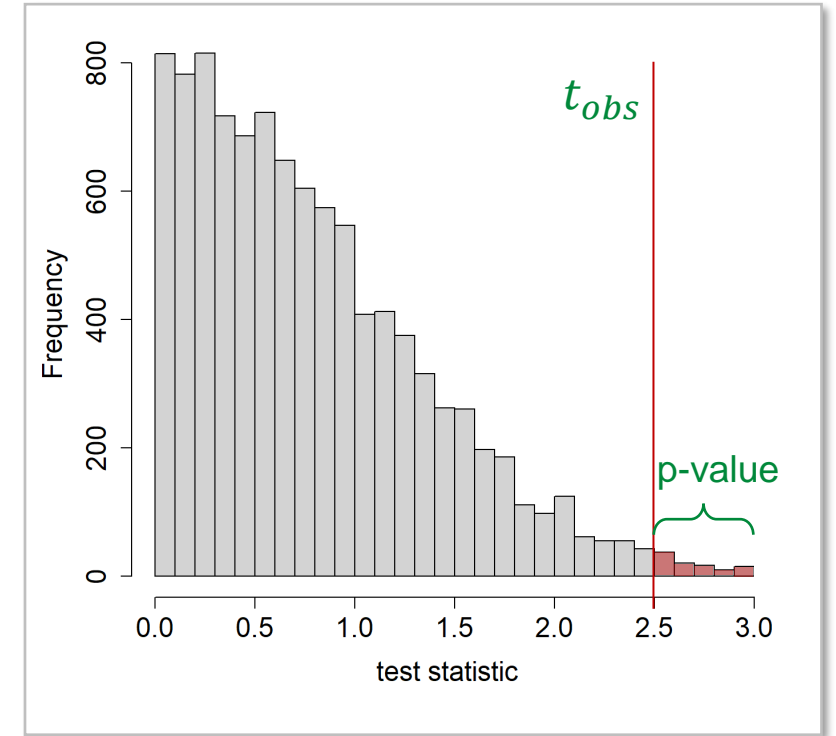

Observed data

Permutations

Distribution of t under H_0 :

Empirical p-value:

$$p = \frac{\sum_{n=1}^N I(t^* \geq t_{obs}) + 1}{N + 1}$$

Low number of permutations (here: $N = 1000$)

Empirical p-value:

$$p = \frac{1}{1001} \approx 0.001$$

→ **Low power in multiple testing setting**

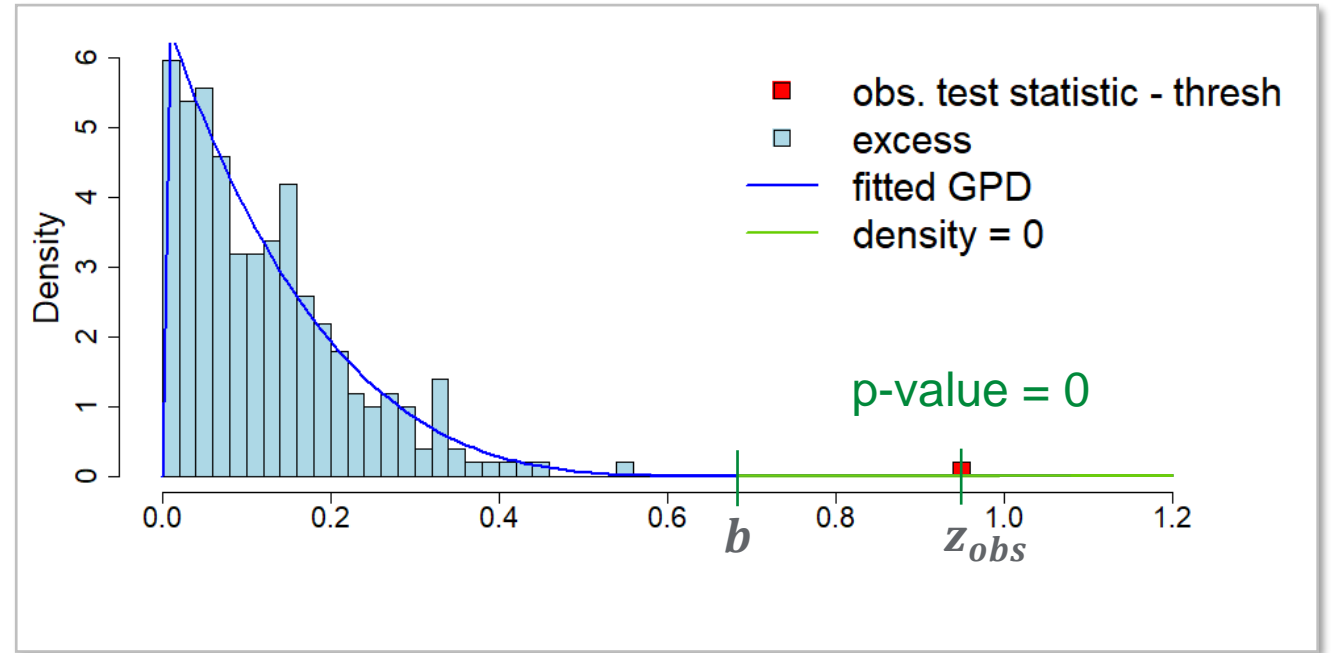

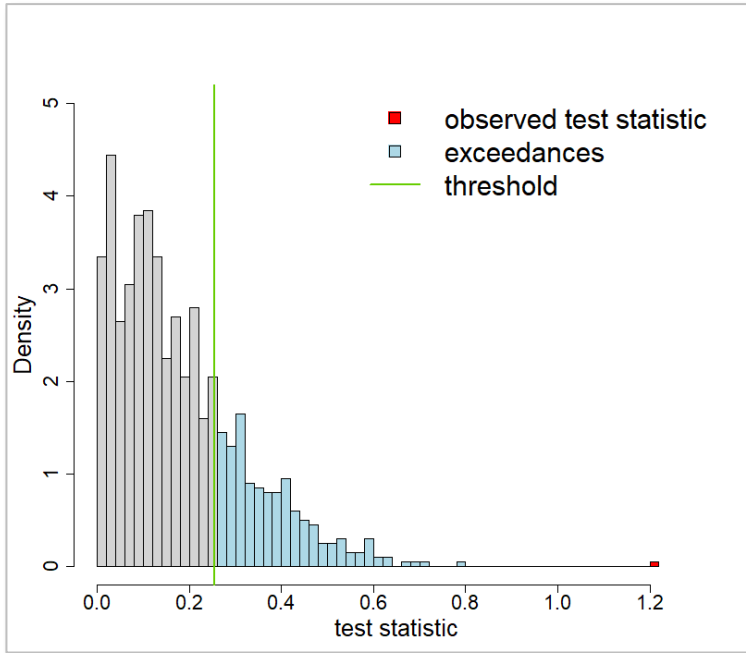

P-value approximation with the Generalized Pareto Distribution (GPD)

$$pval = \frac{N_{exc}}{N} (1 - F(t_{obs} - thresh))$$

P-value approximation with the Generalized Pareto Distribution (GPD)

Estimated GPD parameters:

Shape: $\xi = -0.21785 \rightarrow$ Bounded support

Scale: $\sigma = 0.14890$

P-value is zero for extreme test statistics!
